

■ *JIRA Integration using the OpenEdge HTTP Client*

Peter Judge, Consultingwerk

Peter Judge

- Senior Architect at Consultingwerk
- Writing 4GL since 1996, working on a variety of frameworks and applications. More recently have worked on a lot of integration-y stuff: Authentication Gateway, HTTP Client, Web Handlers. Dabbles in PASOE migrations.
- Active participator in Progress communities, PUGs and other events

Consultingwerk Software Services Ltd.

- Independent IT consulting organization
- Focusing on **OpenEdge** and **related technology**
- Located in Cologne, Germany, subsidiaries in UK, USA and Romania
- Customers in Europe, North America, Australia and South Africa
- Vendor of developer tools and consulting services
- Specialized in GUI for .NET, Angular, OO, Software Architecture, Application Integration
- Experts in OpenEdge Application Modernization

Services Portfolio, Progress Software

- OpenEdge (ABL, Developer Tools, Database, PASOE, ...)
- Telerik DevCraft (.NET, Kendo UI, Angular, ...), Telerik Reporting
- OpenEdge UltraControls (Infragistics .NET)
- Telerik Sitefinity CMS (incl. integration with OpenEdge applications)
- Kinvey Plattform, NativeScript
- Corticon BRMS
- Whatsup Gold infrastructure-, network- and application monitoring
- Kemp Loadmaster
- ...

Services Portfolio, related products

- Protop Database Monitoring
- Combit List & Label
- Web frameworks, e.g. Angular
- .NET
- Java
- ElasticSearch, Lucene
- Amazon AWS, Azure
- DevOps, Docker, Jenkins, ANT, Gradle, JIRA, ...
- ...

What is Jira?

Jira Software is part of a family of products designed to help teams of all types manage work. Originally, Jira was designed as a bug and issue tracker. But today, Jira has evolved into a powerful work management tool for all kinds of use cases, from requirements and test case management to agile software development.

<https://www.atlassian.com/software/jira/guides/use-cases/what-is-jira-used-for#jira-for-agile-teams>

- For many, Jira is life.
- For some, Jira is heaven; for others, hell.

Doesn't Jira Have It All?

- At Consultingwerk, we need to talk to Jira to
 1. Prepare release notes for a release (pull from Jira)
 2. Update tickets with change sets from Perforce (source control)
- Jira provides a RESTful API ... and since we're an ABL shop, we use the ABL HTTP Client
- API is versioned, or use "latest"
/rest/api/2/
/rest/api/latest/
- Doc at <https://docs.atlassian.com/software/jira/docs/api/REST/7.6.1/>

ABL HTTP Client

- Part of the OpenEdge product since 11.5
- Designed to be a REST client
- Platform independent
- Good with JSON
- Assorted "writer" classes to help with conversions to-and-from bytes

```
DEFINE VARIABLE hc AS HttpClient NO-UNDO.  
DEFINE VARIABLE req AS HttpRequest NO-UNDO.  
DEFINE VARIABLE resp AS HttpResponse NO-UNDO.  
DEFINE VARIABLE body AS JsonObject NO-UNDO.
```

```
// reusable client
```

```
hc = ClientBuilder:Build():Client.
```

```
body = NEW JsonObject().
```

```
body:Add('conference', 'PUG UK').
```

```
body:Add('host', 'peter.judge@consultingwerk.com').
```

```
// single request to POST some JSON
```

```
req = RequestBuilder:Post("http://httpbin.org/post", body)  
:Request.
```

```
// Run the request
```

```
resp = hc:Execute(req).
```

```
// process the response
```

```
IF TYPE-OF(resp:Entity, JsonConstruct) THEN
```

```
CAST(resp:Entity, JsonConstruct):WriteFile("data.json").
```

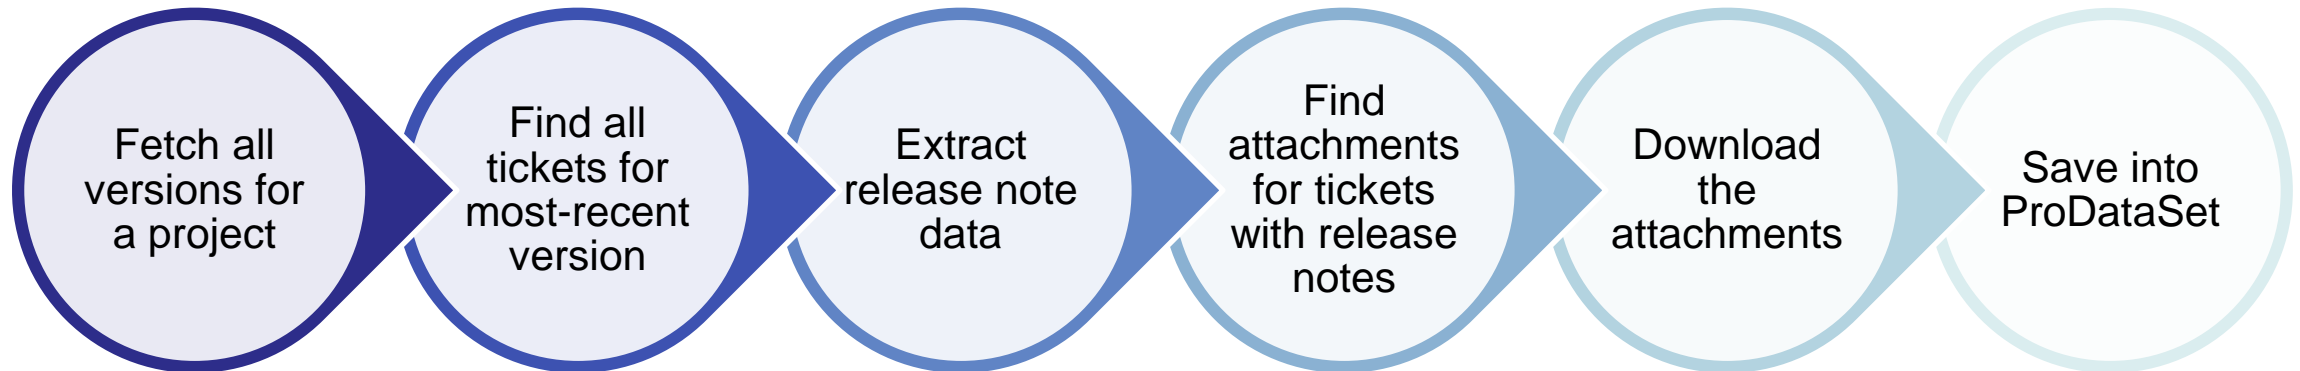

Gotchas

- Authentication is via HTTP basic authentication ... but not using your account password ...
 - Use an API token <https://support.atlassian.com/atlassian-account/docs/manage-api-tokens-for-your-atlassian-account/#Use-an-API-token>
- Assorted HTTP Client issues
 - Client redirects : 303 / See other
 - Client redirects : different HTTPS connections
 - Always sends a User-Agent header

The background of the slide is a dark blue field filled with a complex, light blue circuit diagram. This diagram consists of numerous interconnected nodes, represented by circles and squares, with lines indicating the flow of connections. Various symbols are scattered throughout, including arrows pointing in different directions, a double arrow pointing down, and a double arrow pointing right. The overall aesthetic is technical and digital.

1. Prepare release notes

Generating release notes

Demo: Reading release notes

2. Updating tickets

Commit data in tickets

- When a commit is made to Perforce, a comment is automatically added to a ticket

```

Edit · 😊

Adding comments

- Two approaches
 1. Add comment: `POST /rest/api/2/issue/{issueIdOrKey}/comment`
 2. Update issue: `PUT /rest/api/2/issue/{issueIdOrKey}`

- 1 is tricky due to User-Agent issue
 - 403 / Forbidden
 - "XSRF check failed"
 - To fix, we extend the ABL HTTP Client

Formatted text

- (Any) Formatted text uses Atlassian Document Format
 - JSON document structure
-  Requires API v3 – not /latest/ 
- Formatted comments must be posted as JSON **object** – not strings or stringified JSON
- Jira provides nice "playground" tools, JSON schema and other doc

<https://developer.atlassian.com/cloud/jira/platform/apis/document/structure/>

```
{
  "version": 1,
  "type": "doc",
  "content": [
    {
      "type": "paragraph",
      "content": [
        {
          "type": "text",
          "text": "asgfa"
        }
      ]
    },
    {
      "type": "codeBlock",
      "attrs": {
        "language": "json"
      },
      "content": [
        {
          "type": "text",
          "text": "{\\\"p\\\": [1,4,null, \\\"FF\\\"]}\\n"
        }
      ]
    },
    {
      "type": "paragraph",
      "content": [
        {
          "type": "text",
          "text": "this is a "
        },
        {
          "type": "text",
          "text": "for each ",
          "marks": [
            {
              "type": "code"
            }
          ]
        }
      ]
    }
  ]
}
```

Demo: Comments

3. Other fun things ...

The API is very broad ...

We can

- **Create** issues and sub-tasks
- **Link** issues together (duplicate/clones/blocks/etc)
- Update (edit) issues
- Add **attachments**
- **Assign** issues to a user
- **Transition** issues through states like To Do, In Progress, Done
- Add and remove **watchers**

... And get a bunch of metadata around these operations

Demo: Creating & updating issues

Adding attachments

- Request Content-Type is multipart/form-data (see [RFC2046](#))
- HTTP Client supports
 - MultipartEntity
 - MessagePart
 - Reading / writing to them

```
POST /rest/api/3/issue/DEMO-5/attachments HTTP/1.1
X-Atlassian-Token: no-check
Host: consultingwerk.atlassian.net
Content-Type: multipart/form-data; boundary=b6dc7be0-151d-a38d-a314-e40c7486a364
Content-Length: 3162
Authorization: Basic cGV0ZXIuanVhZ2VAY29uc3VsdGluZ3dlcmsuY29tOnlnUGdCTGNVeDhtUFk4NzRiaVJsMEMzRg==
Accept: application/json

--b6dc7be0-151d-a38d-a314-e40c7486a364
Content-Type: application/octet-stream
Content-Disposition: form-data; filename="README.md"; name="file"

# Accessing JIRA via the ABL HTTP client
This repo contains the source and slides presented at the 2022 PUG Challenge in Vienna.

<< many missing bytes >>

--b6dc7be0-151d-a38d-a314-e40c7486a364--
```

Adding links

- Link Jira issues together
- Add (remote) web links
 - Can group by user-defined "application"

Linked issues +

blocks

GitHub Issues

 Github Issue (1)

Demo: Attachments & links

Fin

- Most of Jira's functionality is available via REST API
 - Jira REST is quite RESTful; once you have a thread, you can usually figure the path out
 - Read the docs – they are generally very good
- One “logical record” can be made up of 4+ REST calls
- Watch out for redirects & issues in the HTTP client
 - Some of which can be worked-around
- Sample code at https://github.com/4gl-fanatics/jira_http

peter.judge@consultingwerk.com
